

Dayton water system restoration update

- Morning of Wednesday, May 29 -

Release Date: Wednesday, May 29, 2019

Contact: Toni Bankston, toni.bankston@daytonohio.gov

There are approximately 60,000 Dayton water customers without water as of 9:00 a.m., Wednesday, May 29. DP&L and City of Dayton crews continued working through the night and are continuing the work this morning.

Dayton's total water production is normally 65 million gallons per day. Currently, about 40 million gallons per day are being pumped.

Dayton has high and low service areas. The water systems fill the low areas and then start filling the high areas. The 40 million gallons currently in production have been filling the low part of the system. This allows us to serve approximately 2/3 of our customers.

The approximately 60,000 water customers currently out of water are in the high zone.

DP&L has restored power to one of the two wellfields. We continue to power the second wellfield through backup generators.

We are awaiting power restoration to the Ottawa Pump Station so that more water can be added to the system. If this is successful, we hope to increase volume into the high areas.

The City is working with the EPA to coordinate the lifting of the boil advisory in the low service area, if the water quality test come back good.

Additional updates will be issued as soon as possible.
